

## Cause-of-death distribution

For any given period and age the colour represents the proportion of deaths by a specific cause on all deaths. Period-age regions where a cause of death is the most common are outlined in black.

Proportion on all deaths

In France 1925–1937, ages 1–5, respiratory diseases were the most common cause of death, accounting for 20–40% of all fatalities within this period-age range.
